Referral Testing

Collected: 09/27/2023 13:32 Received: 09/27/2023 13:32

Table with 6 columns: Test Name, Result, Flag, Ref-Ranges, Units, Site. Row 1: Ehrlichia chaffeensis Ab IgG IgM, <1:64, QDRL. Row 2: E. chaffeensis Ab IgM, <1:20, QDRL. Row 3: Interpretation, SEE BELOW, QDRL.

ANTIBODY NOT DETECTED

REFERENCE RANGE:
IgG <1:64
IgM <1:20

Ehrlichia chaffeensis has been identified as the causative agent of Human Monocytic Ehrlichiosis (HME). Infected individuals produce specific antibodies to E. chaffeensis that can be detected by an immunofluorescent antibody (IFA) test. Single IgG IFA titers of 1:64 or greater indicate exposure to E. chaffeensis. A four-fold rise in IgG titers between acute and convalescent samples and/or the presence of IgM antibody against E. chaffeensis suggest recent or current infection.

This test was developed and its analytical performance characteristics have been determined by Quest Diagnostics. It has not been cleared or approved by FDA. This assay has been validated pursuant to the CLIA regulations and is used for clinical purposes.
