Referral Testing

Collected: 09/27/2023 11:36 Received: 09/27/2023 11:36

Table with 6 columns: Test Name, Result, Flag, Ref-Ranges, Units, Site. Row 1: Echinococcus Antibody IgG, 6, 0-8, U, ARRL

INTERPRETIVE INFORMATION: Echinococcus Antibody IgG

0 - 8 U.....Negative - No significant level of Echinococcus IgG antibody detected.
9 - 11 U.....Equivocal - Recommend repeat testing in 2-4 weeks with fresh sample.
12 U or greater.....Positive - IgG antibodies to Echinococcus detected, indicating current or past infection.

Patients with collagen vascular diseases, hepatic cirrhosis, schistosomiasis, and other parasitic infections can produce false-positive results. There is a strong cross-reaction between echinococcosis and cysticercosis positive sera.

Seroconversion between acute and convalescent sera is considered strong evidence of recent infection. The best evidence for infection is a significant change on two appropriately timed specimens where both tests are done in the same laboratory at the same time.

Performed By: ARUP Laboratories
500 Chipeta Way
Salt Lake City, UT 84108
Laboratory Director: Jonathan R. Genzen, MD, PhD

Performing Site:
