Hepatitis E IgG Ab	NOT DETECTED				QCRL

REFERENCE RANGE: NOT DETECTED

Hepatitis E virus (HEV) is a major cause of enteric non-A hepatitis worldwide. HEV IgG is typically detected within one month after infection, and persists for months to years after recovery. Approximately 20% of the US population is positive for HEV IgG, indicating that HEV exposure is more common than previously thought.

This test was developed and its analytical performance characteristics have been determined by Quest Diagnostics. It has not been cleared or approved by FDA. This assay has been validated pursuant to the CLIA regulations and is used for clinical purposes.

Test Performed at:
Quest Diagnostics Nichols Institute
33608 Ortega Highway
San Juan Capistrano, CA 92675-2042 I Maramica MD, PhD
