Molecular

Collected: 03/17/2020 09:26 Received: 03/17/2020 09:26

Table with 6 columns: Test Name, Result, Flag, Ref-Ranges, Units, Site. Row 1: Tissue Comprehensive Virus Detection, No viruses detected, No viruses detected, WMRL. Row 2: Testing Information, See Below, WMRL.

This specimen was tested for herpes simplex type 1 and 2, cytomegalovirus, adenovirus and enterovirus by individual PCR reactions.

The nucleic acid targets the glycoprotein G gene of HSV-1, the glycoprotein G/J junction of HSV-2, the CMV DNA polymerase gene, the adenovirus hexon gene, and the 5' non-translated region of the enterovirus genome. The analytical sensitivity of these assays are 100 copies/mL for HSV-1, and HSV-2; 150 copies/mL for enterovirus; 200 copies/mL for adenovirus; and 600 copies/mL for CMV.

This procedure utilizes multiple real-time polymerase chain reaction amplification and detection tests. A "Not detected" result does not rule out infection.

This test uses commercial reagents that have not been approved or cleared by the FDA. The FDA has determined that such clearance or approval is not necessary. The performance characteristics of this procedure were determined by Warde Medical Laboratory.

This test is performed pursuant to a license agreement with Roche Molecular Systems, Inc.
