Collected: 09/06/2023 14:44 Received: 09/06/2023 14:44

Table with 6 columns: Test Name, Result, Flag, Ref-Ranges, Units, Site. Row 1: T Cell Rec Gamma Gene Rear PCR, NA, AB, NEGATIVE, QCRL.

Test Performed at:
Quest Diagnostics Nichols Institute
33608 Ortega Highway
San Juan Capistrano, CA 92675-2042 I Maramica MD, PhD, MBA

Pathologist Interpretation SEE NOTE QCRL

This specimen was positive for the detection of clonal T-cell receptor gamma chain gene rearrangement by PCR, which suggests the presence of a clonal population of T-cells except with immature lymphoid malignancies where clonal TCR-gamma rearrangements may occur in other lineages. The positive result should be interpreted in the context of the patient's other clinical and pathologic features and should not be used as the sole criterion for diagnosing malignancy. Certain conditions may yield a false positive result, including, but not limited to, autoimmune diseases, congenital and acquired immune deficiency syndromes and reactive expansions in blood. If you are a physician and have questions about the interpretation of this test result or correlating it with the morphology of the tissue, please call (800) 642-4657, ext. 2906. Results reviewed by Z. Zhang, M.D.
