Referral Testing

Collected: 09/25/2023 08:48 Received: 09/25/2023 08:48

Table with 6 columns: Test Name, Result, Flag, Ref-Ranges, Units, Site. Row 1: Cysticercus Ab, 1, <=8, U, ARRL

INTERPRETIVE INFORMATION: Cysticercosis Ab, IgG by ELISA

- <9 U Negative - No significant level of cysticercosis IgG antibody detected.
9-11 U Equivocal - Recommend repeat testing in 2-4 weeks with fresh sample.
>11 U Positive - IgG antibodies to cysticercosis detected, which may suggest current or past infection.

Seroconversion between acute and convalescent sera is considered strong evidence of recent infection. The best evidence for infection is a significant change on two appropriately timed specimens where both tests are done in the same laboratory at the same time.

Patients with collagen vascular diseases, hepatic cirrhosis, schistosomiasis, and other parasitic infections can produce false-positive results. There is a strong cross-reaction between cysticercosis and echinococcosis positive sera. Confirmation of positive ELISA results by the cysticercosis antibody, IgG by Western Blot is recommended.

Performed By: ARUP Laboratories
500 Chipeta Way
Salt Lake City, UT 84108
Laboratory Director: Jonathan R. Genzen, MD, PhD
CLIA Number: 46D0523979

Performing Site:
