Immunology

Collected: 09/28/2021 08:27 Received: 09/28/2021 08:27

Table with 6 columns: Test Name, Result, Flag, Ref-Ranges, Units, Site. Rows include Quantiferon TB Plus, Nil, Mitogen, TB Ag 1, TB Ag 2, and Quantiferon TB Plus with results like 0.0270, 0.739, 0.0306, 0.0264, Negative, and Negative.

A Negative result suggests that M. tuberculosis complex infection is not likely. However, a negative result does not rule out infection, particularly in patients with impaired immune function or patients suspected to have M. tuberculosis disease.

This test should not be used as the sole means for diagnosing or excluding active or latent tuberculosis. For more information, refer to the CDC guidelines for using interferon gamma release assays to detect Mycobacterium tuberculosis infection (MMWR 2010;59 (RR-05):1-25).

The performance characteristics of the QFT-Plus test has not been evaluated in immune compromised patients, patients taking immunosuppressive drugs, pregnant women, and individuals younger than 18 years of age. Caution is warranted when evaluating QFT-Plus results from patients who have clinical conditions such as diabetes, silicosis, chronic renal failure, and hematological disorders (e.g., leukemia and lymphomas), or those with other specific malignancies (e.g., carcinoma of the head or neck and lung).
