Immunology

Collected: 09/28/2021 10:30 Received: 09/28/2021 10:30

Table with 6 columns: Test Name, Result, Flag, Ref-Ranges, Units, Site. Rows include Quantiferon TB Plus, Nil, Mitogen, TB Ag 1, TB Ag 2, and Quantiferon TB Plus with results like 0.435, >10.0, and POSITIVE.

A POSITIVE result suggests that M. tuberculosis complex infection is likely. This test will detect interferon gamma responses from individuals infected with M. tuberculosis, M. kansasii, M. szulgai, and M. marinum but not from BCG-vaccinated individuals without disease or risk for latent TB infections.

This test should not be used as the sole means for diagnosing or excluding active or latent tuberculosis. For more information, refer to the CDC guidelines for using interferon gamma release assays to detect Mycobacterium tuberculosis infection (MMWR 2010;59 (RR-05):1-25).

The performance characteristics of the QFT-Plus test has not been evaluated in immune compromised patients, patients taking immunosuppressive drugs, pregnant women, and individuals younger than 18 years of age. Caution is warranted when evaluating QFT-Plus results from patients who have clinical conditions such as diabetes, silicosis, chronic renal failure, and hematological disorders (e.g., leukemia and lymphomas), or those with other specific malignancies (e.g., carcinoma of the head or neck and lung).
