Collected: 12/28/2023 11:37

Flow Cytometry, B-Cell Neoplasia Panel

Source: Peripheral blood

Flow Cytometry Interpretation:

No evidence of a clonal or immunophenotypically abnormal B-lymphocyte population by flow cytometry.

Morphology:

The Wright stained blood smear reveals a mixture of lymphocytes, monocytes, and neutrophils. No significant increase in mature lymphocytes is seen, and there are no blasts identified.

Comment :

Immunophenotyping by flow cytometry reveals that B-cells comprise approximately 30% of total lymphocytes in the sample. The B-cells show a polytypic pattern of surface light chain expression, and they do not show evidence of an abnormal pattern of surface antigen expression. In summary, there is no evidence of a clonal or immunophenotypically abnormal B-lymphocyte population in the sample by this analysis. Please correlate with morphologic and clinical findings, since the absence of a clonal or immunophenotypically abnormal cell population by flow cytometry does not rule out the possibility of neoplasia.
