Collected: 12/28/2023 11:28

Flow Cytometry, B-Cell Clonality Screen

Source: Lymph node, Right Axillary

Flow Cytometry Interpretation:

No evidence of a clonal or immunophenotypically abnormal B-lymphocyte population by flow cytometry.

Morphology:

The Wright stained cytospin reveals a predominant mixture of small to large lymphoid cells.

Comment :

Immunophenotyping by flow cytometry reveals that B-cells comprise approximately 20% of total lymphocytes in the sample. The B-cells show a polytypic pattern of surface light chain expression, and they do not show evidence of an abnormal pattern of surface antigen expression. In summary, there is no evidence of a clonal or immunophenotypically abnormal B-lymphocyte population in the sample by this analysis. Please correlate with morphologic and clinical findings, since the absence of a clonal or immunophenotypically abnormal cell population by flow cytometry does not rule out the possibility of neoplasia.
