Referral Testing

Collected: 07/19/2023 10:57 Received: 07/19/2023 10:57

Table with 6 columns: Test Name, Result, Flag, Ref-Ranges, Units, Site. Row 1: Adenosine Deaminase, RBC, 500, 400-900, mU/g Hb, ARRL

INTERPRETIVE INFORMATION: Adenosine Deaminase, RBC

Adenosine deaminase (ADA) deficiency is an autosomal recessive disorder of purine metabolism primarily affecting lymphocyte development, viability, and function. Affected individuals have less than 1 percent of normal ADA catalytic activity in red cell hemolysates. ADA deficiency is the cause of 20-30 percent of SCID cases. If the patient has been recently transfused, ADA deficiency may be masked; interpret results with caution. Heterozygotes cannot be identified by this test.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.
