Table with 6 columns: Test Name, Result, Flag, Ref-Ranges, Units, Site. Row 1: Cow's Milk IgG, <2.0, <2.0, mcg/mL, QDRL

The occurrence of IgG antibodies to cow's milk is a physiologic phenomenon without diagnostic significance. We recommend testing IgE Casein (#F78) if cow's milk allergy is suspected as casein is the major allergenic and antigenic protein in cow's milk. (Keller KM, et al., Klin Paediatr 1999;211:384-8.)

This test was performed using a kit that has not been cleared or approved by the FDA. The analytical performance characteristics of this test have been determined by Quest Diagnostics. This test, and any food specific allergen IgG result, should not be used for the diagnosis of allergic or atopic disease states (except for sensitivity to milk in neonates and gluten sensitivity). The use of food specific allergen IgG results should be restricted to the assessment of response to therapeutic interventions.
