Factor V Leiden Mutation Analysis

Factor V Leiden Mutation Negative WMRL

The pathogenic F5 Leiden variant (c.1691G>A) was NOT DETECTED. The specimen was determined to be homozygous for the wild type (WT) F5 gene. This test does not rule out other mutations that may contribute to venous thrombosis.

This test was performed using the cobas® Factor V Test (Roche) - an in vitro diagnostic device that uses real-time quantitative Polymerase Chain Reaction (qPCR) for the detection and genotyping of the human factor V (F5) gene. The test detects the presence of the wild type (WT) F5 gene and the pathogenic c.1691G>A variant (also known as the F5 Leiden variant) in genomic DNA isolated from whole blood specimens as an aid in diagnosing patients with suspected thrombophilia. The cobas® Factor V Test and the cobas z 480 analyzer are used together for automated amplification and detection. The limit of detection for this test is 0.1 ng/uL of genomic DNA (2.5 ng/PCR reaction).

Performing Site:
