The gestational age is based on an EDD of 12/01/2023 as determined by ultrasound.

Interpretation SeeBelow WMRL

This is the initial sample received at Warde Laboratory.

SCREEN NEGATIVE FOR DOWN SYNDROME, NEURAL TUBE DEFECTS AND TRISOMY 18.

Additional Test Information: The QUAD screen provides a risk estimate, not a diagnosis. Incorrect or missing information may considerably alter results.

A positive report is indicated when the Down syndrome risk is greater than or equal to 1:270, the risk for Trisomy 18 is greater than or equal to 1:100, or when the AFP MOM is greater than or equal to 2.20.

Risks in twins cannot be precisely estimated because the relative contribution of each twin to serum marker levels cannot be determined. Maternal weights less than 65 lbs or greater than 440 lbs are truncated and risk is estimated. Assessment is adjusted for IVF, donor eggs, frozen embryos, insulin-dependent diabetic status, weight, race and smoking. Previous pregnancies affected with a neural tube defect or Down syndrome may significantly affect current results.
