Collected: 03/17/2020 09:34 Received: 03/17/2020 09:34

Table with 6 columns: Test Name, Result, Flag, Ref-Ranges, Units, Site. Row 1: Virus Culture, Specimen Source, VC Interpretation, Nasopharyngeal Swab, No Growth, No Growth, WMRL, WMRL.

This culture procedure will not reliably detect cytomegalovirus (CMV), enteroviruses, noroviruses, respiratory syncytial virus (RSV), and varicella-zoster virus (VZV). PCR methods are recommended for these viral agents.

A negative result does not preclude viral infection. The viability of viral agents can be degraded if specimens are improperly collected or stored. The number of viable virus particles may be below the detection threshold and some viral agents cannot be detected or propagated in culture.

A positive result does not preclude infection with other viruses. Fast growing viruses can destroy the cell sheet and prevent the growth of slower growing viruses. Some viruses directly interfere with the replication of other viruses and some viruses cannot be detected or propagated in culture.
