Molecular

Collected: 08/01/2024 13:43 Received: 08/01/2024 13:43

Table with 6 columns: Test Name, Result, Flag, Ref-Ranges, Units, Site. Rows include Client Source, Specimen Source, Herpes simplex Type 1, Herpes simplex Type 2, Varicella Zoster Virus, Cytomegalovirus, Adenovirus, Enterovirus, Rhinovirus, Norovirus Group 1, and Norovirus Group 2.

This specimen was tested for multiple viruses by individual PCR reactions. The nucleic acid targets may include the glycoprotein G gene of HSV-1, the glycoprotein G/J junction of HSV-2, the VZV open reading frame 62, the CMV DNA polymerase gene, the adenovirus hexon gene, the 5' non-translated region of the enterovirus genome, the 5' untranslated region of rhinovirus, and the RNA polymerase gene of norovirus.

The specific viruses tested depend on the specimen source and are indicated in the result field. The analytical sensitivity for these assays are 50 copies/mL for HSV-1, HSV-2, and VZV; 150 copies/mL for enterovirus; 200 copies/mL for adenovirus and rhinovirus; 600 copies/mL for CMV, and 100 copies/mL for norovirus.

This procedure utilizes multiple real-time polymerase chain reaction amplification and detection tests. A "Not detected" result does not rule out infection.

This test uses commercial reagents that have not been approved or cleared by the FDA. The FDA has determined that such clearance or approval is not necessary. The performance characteristics of this procedure were determined by Warde Medical Laboratory.

Table with 3 columns: Test Name, Result, Site. Rows include Rhinovirus, Norovirus Group 1, and Norovirus Group 2.

Reported Date: 08/01/2024 13:44 CVP
